Health and Education Development Level Disparities in Indian States

Satbir Singh* And Ved Pal**

Corresponding Author: Satbir Singh

ABSTRACT: The level of development of different states of India was obtained with help of composite index based on optimum combinations of five educationas well as health development indicators. The study utilizes very recent time point for measurement of development for seventeen non-specific states of India. It is found that Gujarat scores first rank in the health development whereas Odisha stands on the last position. In case of educational development, Maharashtra occupies first position while Andhra Pradesh performs very poor in the indicator. Wide disparities have been observed in the level of development between different states of India. Also, Health facilities of the people were found to be positively associated with education development.

KEY-WORDS: composite index, health and education development, Indian states.

I INTRODUCTION

India is a constitutional republic in South Asia, with world's second largest population, an economy currently ranked 9th in terms of GDP (nominal), a rapidly developing country which yet has significant amount of poverty and world largest democracy. Education in India is provided by the public sector as well as the private sector, with control and funding coming from three levels: central, state and local. Under various articles of the Indian constitution, free and compulsory education is provided as a fundamental right to children between the ages of 6 and 14. The ratio of public schools to private schools in India is 7:5. India has made progress in terms of increasing the primary education attendance rate and expanding literacy. India's improved education system is often cited as one of the main contributions to its economic development. While enrolment in higher education has increased steadily over the past decade, reaching a gross enrolment ratio of 24% in 2013. The National Council of Educational Research and Training (NCERT) is the apex body that makes the curriculum related matters for school education across India. However, due to shortage of resources and lack of political will, this system suffers from massive gaps including high pupil to teacher ratios, shortage of infrastructure and poor levels of teacher training. There have been several efforts to enhance quality made by the government. The District Education Revitalization Programme (DERP) was launched in 1994 with an aim to universalize primary education in India. The main governing body at the tertiary level is the University Grants Commission, which enforces its standards, advice the government and helps coordinate between the Centre and state. The constitution of India makes health in India the responsibility of state governments, rather than the central federal government. It makes every state responsible for "raising the level of nutrition and the standard of living of its people and the improvement of public health as among its primary duties". The National Health policy was endorsed by the parliament of India in 1983 and updated in 2002. The National Health Policy is being worked upon further in 2017. There are great inequalities in health between states. Infant mortality in is 12 per thousand live births, but in aim it is 56. Due to their lower social status, girls are for more at risk of malnutrition than boys their age. Partly as a result of this cultural bias, up to one third of all adult women in India are underweight. Despite health improvements over last thirty years, lives continue to be lost to early childhood diseases. HIV/AIDS in India is ranked third highest among countries with HIV-infected patients. National AIDS Control Organization, a government 'APEX BODY' is making efforts for managing the HIV/AIDS epidemic in India. These diseases can be attributed to poor sanitation and inadequate safe drinking water. India has the world's highest incidence of rabies. In 2012 India was polio-free for the first time in its history. This was achieved because of the pulse polio programme started in 1995-96 by the government. As more than 122 million households have no toilets and 33 percent lack access to latrines, over 50 percent of the population defecates in the open. This is relatively higher than Bangladesh and Brazil (7 percent).

II LITERATURE REVIEW

In the existing literature, no. of studies tried to measure the regional disparities by the socio-economic, health and educational indicator. The prominent work by Narain (1991, 92, 94, 2003 & 2005) studied for estimating the level of development at district level had so for been made for the states of Orissa, Andhra...
Indian states. The study is an effort for evaluating the status of development at state level separately for health sector and educational sector for Indian states. It would be of interest to estimate the status of development at state level, since there has been growing consensus about the need of state level planning in the country. Under these are following objectives.

III OBJECTIVES

• To measure the relative performance of health and educational development for Indian states.
• To identify the relationship between health and education development level for India.

IV RESEARCH METHODOLOGY

As development is a multi-dimensional process, so its impact cannot be fully captured by any single indicator. A number of indicators when analyzed individually do not provide an integrated picture of reality. Hence, there is a need for building up of a composite index of development based on optimum combinations of various education and health development indicators. Some states have faced situational factors of development unique to it as well as common and environmental factors. Common indicators to all the states have been included in the analysis for evaluating the level of development. Composite indices of development have been obtained for different states by using the data on the following development indicators:-

Health development indicators:
1. Percentage expenditure on medical and public health and family welfare as ratio to aggregate expenditure.
2. Percentage access safe drinking water in household
3. Per capita availability of milk(gram)
4. Infant mortality rate
5. Death rate

Education development indicators:
1. Literacy
2. Gross enrolment ratio in classes (1-8)
3. Percentage expenditure on education as ratio to aggregate expenditure
4. No. of universities
5. No. of colleges

A total of ten education and health development indicators have been taken for the analysis. These indicators may not form an all-inclusive list but these are the major interacting components of development. Out of ten indicators, five indicators are directly related with the health sector and five are concerned with education development in the states of India.

Sample Design

Current study is based on the secondary data derived from the Reserve Bank of India, “Hand book statistics on Indian states” and Economic Survey Reports of the state and official websites of the states.
secondary data has been collected for a year 2013-14. The composite index for education and health performance of the different states of India has been calculated on the basis of Wroclaw Taxonomic method which has been explained in detail.

V RESEARCH METHOD

The composite index of development is constructed applying Wroclaw Taxonomic Method developed by Florek et al. (1952) and Narain et al. (1991) have also used this statistical method for calculating the Composite index which can include any number of indicators. Let \([X_{ij}]\) be the data matrix, \(i = 1, 2, \ldots, n\) (Number of unit) and \(j = 1, 2, \ldots k\) (number of indicators). \([X_{ij}]\) are transformed to \([Z_{ij}]\) as follows:

\[
[Z_{ij}] = \frac{(X_{ij} - X_j)}{S_j}
\]

\(X_j\) = mean of the \(j\)th indicator, \(S_j\) = standard deviation of the \(j\)th indicator and \([Z_{ij}]\) is the matrix of standardized indicators. From \([Z_{ij}]\), identify the best value of each indicator, maximum value or minimum value depending upon the direction of the impact of indicator on the development.

\[
P_{ij} = (Z_{ij} - Z_{oj})^2
\]

\([C.V.]_j = \frac{\sum_{j=1}^{k} P_{ij}}{C} / (C.V.)_j\)

Where \(P_{ij}\) = pattern of development, \(Z_{oj}\) = Best value for indicator, and \((C.V.)_j\) is the coefficient of variation of the \(j\)th indicator in \(X_{ij}\).

\(D_i\) (Composite Index) = \(C_i / C\)

Where \(C = (\text{Mean Value of } C_i + 3 \times \text{Standard deviation of } C_i)\)

VI RESULTS AND DISCUSSION

Development level

The composite indices of health and education development have been worked out for nonspecific state of India in respect of health sector and education sector. The states have been ranked on the basis of composite indices. The values of composite indices along with the rank of states are given in Table 1. It may be seen from Table 1 that in case of education development, the state of Maharashtra was ranked first the state of Andhra Pradesh was ranked last. The composite indices varied from 0.414 to 0.890. Health facilities play a very important role in enhancing the level of development in the state. With respect to these facilities, the state of Gujarat was ranked first and the state of Odisha was ranked last. The composite indices varied from 0.28 to 0.82 across states.

Inter-relationship among education and health sector in the Indian Economy:-

www.ijbmi.org
For proper development, it is essential that two sectors of the economy should flourish together. The association between the level of development of health sector of economy and education level is worked out and presented in table 2. It may be seen from the below table.

### Table 2: Correlation Coefficient

<table>
<thead>
<tr>
<th>Factors</th>
<th>Education Development</th>
<th>Health Development</th>

</thead>
<tbody>
<tr>
<td>Education</td>
<td>1</td>
<td>0.37</td>
</tr>
<tr>
<td>Health Development</td>
<td>0.37</td>
<td>1</td>
</tr>
</tbody>
</table>

Source: Authors' Calculation

It is found from the above table the education development is positively correlated with health development (+0.37).

VII CONCLUSION:

The study concludes that with respect education development, the state of Maharashtra and Tamilnadu are found to be better developed in comparison to other states. The states of Andhra Pradesh and Bihar are low developed. Special care should be taken for the implementing the developmental programmes in these states. Health facilities are found to be better in states of Gujarat and Goa. These facilities are poor in the states of Odisha, Madhya Pradesh and Andhra Pradesh. Health development is associated with education development. Health facilities are also found to be positively affected the education level.
